Brahmaputra valley flood extent, three Sentinel-1 acquisitions, August 2016

Each date mapped independently on its own swath. Monsoon season, Kharif 2016, central Brahmaputra valley, Assam and adjoining states

LEGEND

- Permanent water — *JRC occurrence ≥ 50%*
- Flood water — *dark on the date, not permanent*
- Land, imaged
- No data — *outside the swath, or edge buffer*

The three maps are never merged. The 12 August pass is relative orbit 77 and images 6.26 M ha; 7 and 31 August are orbit 4 and image 3.17 and 3.16 M ha. Mosaicking them would join surfaces observed at different incidence angles on different days, and would misstate area by roughly 9,150 ha. Where a panel is white, nothing was observed, which is not the same as observing no water. Imaged area is measured after the 640 m swath-edge buffer has been set to no data. Areas are counted at full resolution; the display is decimated 6× for drawing only.

Projection EPSG:32646 (UTM zone 46N), 20 m pixel · Sentinel-1A IW GRD, RTC gamma0, VH · map-optimal operating point, −18.75 dB · cropland is ESA WorldCover class 40 · produced 12 October 2026
