

Brahmaputra valley flood extent, three Sentinel-1 acquisitions, August 2016

Each date mapped independently on its own swath. Monsoon season, Kharif 2016, central Brahmaputra valley, Assam and adjoining states

7 August 2016

relative orbit 4

12 August 2016

relative orbit 77

31 August 2016

relative orbit 4

LEGEND

Permanent water

JRC occurrence $\geq$ 50%

Flood water

dark on the date, not permanent

Land, imaged

No data

outside the swath, or edge buffer

The three maps are never merged. The 12 August pass is relative orbit 77 and images 6.26 M ha; 7 and 31 August are orbit 4 and image 3.17 and 3.16 M ha. Mosaicking them would join surfaces observed at different incidence angles on different days, and would misstate area by roughly 9,150 ha. Where a panel is white, nothing was observed, which is not the same as observing no water. Imaged area is measured after the 600 m swath-edge buffer has been set to no data. Areas are counted at full resolution; the display is decimated 6× for drawing only.
